ABSTRACT OF THE INVENTION

A method and a client/server system for managing content for distribution comprising is disclosed. The invention has particular (but not exclusive) application to managing content in the form of web pages for distribution by a web server. A delegator identifies content to

5   be worked upon and delegates the work to a delegatee. A server sends to the delegatee a manifest describing the delegated work, the manifest defining the extent of work to be done. The server receives content from the client together with the returned manifest, each manifest and the associated content being digitally identified by the delegatee. The returned content is accepted by the server only upon verification of the digital identification.
